

ACP[®] 215

Automated Cell Processor

Making strategic blood programs
a practical reality

HAEMONETICS[®]

The next step in red blood cell processing technology

The practical route to a clear future: **ACP® 215 Automated Cell Processor**

Rare blood storage

The ACP 215 allows hospitals and donor centers to improve the availability of rare blood safely and efficiently. The automated glycerolization and deglycerolization processes significantly reduce manual labor and overall procedure time while providing more efficient red cell management.

The ACP® 215 Automated Cell Processor is the world's first automated, closed system processor of red blood cells. It minimizes the risk of bacterial contamination, while giving donor centers and hospitals the safety and flexibility they need. Whether your facility is washing red blood cells, pursuing rare blood collection or ultimately building a complete strategic blood reserve program, Haemonetics is there every step of the way to help implement your entire plan.

Cell Washing

Extended storage of washed red cells enables hospitals and blood centers to establish washed red cell inventories to cover weekends or holidays.

Strategic blood reserves

Strategic blood storage is a life-saving initiative. Proactive management of collection surpluses allows donor centers to operate more effectively during periods of need. The closed system of the ACP 215 minimizes the risk of bacterial contamination and readily prepares red blood cells for long-term frozen and extended post-thaw storage.

Advanced processing

The ACP 215 is a closed system cell processor with integrated process control.

- Decreased risk of bacterial contamination
- Transfusions with lower risk of patient reaction
- Extended post post-thaw and post-wash storage*
- cGMP-compliant
- Reduced risk of human error

*Consult your local sales representative for specific clearances

Practical performance

The ACP 215 is currently employed by blood centers, hospital blood banks and military organizations around the world under the most strenuous conditions.

- Automated glycerolization and deglycerolization
- Significantly reduced manual processes
- Integrated reporting of procedure statistics
- Compact and portable design accommodates space constraints

Take the next step for your strategic blood program with the ACP[®] 215 Automated Cell Processor
